PROFESSIONAL SUMMARY

DevOps Engineer specializing in production-grade AWS infrastructure, GitOps CI/CD pipelines, and Kubernetes observability. Proficient in ArgoCD, Prometheus/Grafana/Loki, GitHub Actions, Terraform, and EKS — with a consistent focus on automation, security hardening, and zero-downtime deployments. Pursuing a BS in Computer Science. Open to remote and Pakistan-based DevOps, Cloud, and Platform Engineering roles.

TECHNICAL SKILLS

Cloud — AWS: EC2, VPC, ALB, Auto Scaling, EKS, RDS, S3, IAM, DynamoDB, CloudWatch, Route 53

CI/CD & GitOps: GitHub Actions, ArgoCD, Jenkins, Helm

Containers & Orchestration: Docker, Kubernetes (EKS, kubeadm), Helm

Infrastructure as Code: Terraform (modules, remote state, DynamoDB locking), Ansible

Observability: Prometheus, Grafana, Loki, Alertmanager, kube-prometheus-stack

Languages & Scripting: Python, Bash

HANDS-ON EXPERIENCE

DevOps & Cloud Infrastructure Engineering

Sep 2025 – Present · Remote

- ▶ Designed and deployed production-grade AWS infrastructure using Terraform — including VPC networking, load balancing, auto scaling, and managed databases — fully automated with no manual console interaction.
- ▶ Built and operated a GitOps-based CI/CD system using GitHub Actions and ArgoCD on Kubernetes, enabling zero-downtime releases with automated rollback on failure.
- ▶ Implemented full-stack Kubernetes observability with Prometheus, Grafana, and Loki — including alerting pipelines and log aggregation for real-time cluster health monitoring.
- ▶ Applied AWS security best practices across all environments: IAM least-privilege policies, private subnet isolation, encrypted remote state, and RBAC-enforced access controls.

ENGINEERING PROJECTS

End-to-End GitOps CI/CD Pipeline

GitHub Actions · ArgoCD · Kubernetes · Docker · Helm · Python · github.com/irfanjat/gitops-cicd-pipeline

- ▶ Designed a dual-repository GitOps architecture — GitHub Actions handles CI (test, build, push, SHA-tag) while ArgoCD drives continuous delivery on Kubernetes with self-healing and readiness probe validation.
- ▶ Achieved zero-downtime deployments with automatic rollback on failure; every release is traceable to a Git commit.
- ▶ Configured Helm chart templating with environment-specific value overrides for consistent deployments across staging and production.

Production Multi-Tier AWS Infrastructure — Terraform IaC

Terraform · VPC · EC2 · ALB · Auto Scaling · RDS · S3 · DynamoDB · github.com/irfanjat/terraform-aws-infra

- ▶ Provisioned production-grade AWS infrastructure across reusable Terraform modules (vpc, security_groups, alb, ec2, rds) with S3 remote state, DynamoDB locking, and AES-256 encryption — zero manual console interaction.
- ▶ Enforced IAM least-privilege policies and private subnet isolation for all database instances; full security compliance across dev, staging, and production.
- ▶ Structured modular IaC patterns enabling complete environment replication without code duplication.

Kubernetes Observability Platform

Prometheus · Grafana · Loki · Alertmanager · Helm · github.com/irfanjat/k8s-observability

- ▶ Deployed full-cluster observability using kube-prometheus-stack and loki-stack Helm charts with version-controlled PrometheusRule CRDs and structured alert routing.
- ▶ Built a unified Grafana dashboard combining live Loki log streams, CPU/memory metrics, and node-level health — giving complete cluster visibility in a single view.

- ▶ Configured Alertmanager routing for instant incident notification, reducing mean time to detection and response for cluster-level anomalies.

CERTIFICATIONS

AWS Cloud Technical Essentials — Amazon Web Services / Coursera

EDUCATION

Bachelor of Science in Computer Science · Expected May 2027

University of Sindh (SULC), Jamshoro, Pakistan

Relevant Coursework: Operating Systems, Computer Networks, Data Structures, Database Systems, Linear Algebra, Compiler Construction
