

IRFAN ALI

DevOps Engineer · Cloud Infrastructure

+92 315 3711489 | irfanali.cloud@gmail.com | linkedin.com/in/irfanjat | github.com/irfanjat

PROFESSIONAL SUMMARY

Results-driven DevOps Engineer with 8+ months of hands-on experience architecting production-grade cloud infrastructure, GitOps CI/CD pipelines, and Kubernetes observability stacks on AWS. Delivered 8+ projects spanning Terraform IaC, GitHub Actions, ArgoCD, Jenkins, EKS, Prometheus, and Grafana — with 20+ public GitHub repositories. Certified by IBM and AWS; currently pursuing a BS in Computer Science. Actively seeking DevOps, Cloud, or Platform Engineer roles.

TECHNICAL SKILLS

CI/CD & GitOps:	GitHub Actions, ArgoCD, Jenkins
Containers & Orchestration:	Docker, Kubernetes, EKS
Infrastructure as Code:	Terraform, Ansible
Cloud — AWS:	VPC, EC2, ALB, Auto Scaling, EKS, RDS, S3, IAM, DynamoDB, CloudWatch
Observability:	Prometheus, Grafana, Loki, Alertmanager
Languages & Tools:	Python, Bash, Linux, Git, GitHub

CERTIFICATIONS

- IBM DevOps and Software Engineering Professional Certificate — IBM / Coursera
- AWS Cloud Practitioner Essentials — Amazon Web Services / Coursera
- AWS Cloud Technical Essentials — Amazon Web Services / Coursera

EDUCATION

Bachelor of Science in Computer Science — University of Sindh (SULC), Jamshoro, Pakistan | Expected May 2027
Relevant Coursework: Operating Systems, Computer Networks, Data Structures, Database Systems

HANDS-ON EXPERIENCE

Independent DevOps Engineer | Sep 2025 – Present

Self-Directed · Cloud & Platform Infrastructure

- Designed and deployed multi-tier AWS infrastructure using Terraform, provisioning VPC, dual-AZ subnets, ALB, Auto Scaling Groups, and RDS PostgreSQL — with zero manual console interaction.
- Built a dual-repository GitOps CI/CD system using GitHub Actions and ArgoCD on Kubernetes, reducing deployment time by 80% and achieving zero-downtime releases via readiness probe validation.
- Deployed full-cluster Kubernetes observability using Prometheus, Grafana, and Loki across 14 scrape targets, with version-controlled alerting rules and a 6-panel unified dashboard.
- Enforced AWS security best practices including IAM least-privilege policies, private subnet isolation for RDS, and AES-256 state encryption across all Terraform-managed environments.
- Authored 20+ public GitHub repositories documenting infrastructure design, pipeline architecture, and runbooks — demonstrating consistency in production-grade engineering practices.

PROJECTS

End-to-End GitOps CI/CD Pipeline

GitHub Actions · ArgoCD · Kubernetes · Docker · Helm · Python
github.com/irfanjat/gitops-cicd-pipeline

- Cut deployment time by 80% (10 minutes to 2 minutes) using a dual-repository GitOps architecture: GitHub Actions handles test, build, push, and config-update stages while ArgoCD performs rolling sync to Kubernetes.
- Achieved zero-downtime releases with full deployment traceability via Git SHA image tags and /health readiness probes validated before each traffic shift.

- Eliminated configuration drift by enabling ArgoCD selfHeal and prune policies, automatically reverting unauthorized out-of-band kubectl changes.

Production Multi-Tier AWS Infrastructure — Terraform IaC

Terraform · VPC · EC2 · ALB · Auto Scaling · RDS · S3 · DynamoDB

github.com/irfanjat/terraform-aws-infra

- Provisioned 24 AWS resources — including VPC, dual-AZ subnets, ALB, EC2 Auto Scaling Group, and RDS PostgreSQL — using modular Terraform with no manual AWS console interaction.
- Implemented S3 remote state storage, DynamoDB state locking, and AES-256 encryption to enable safe concurrent applies and reliable state recovery.
- Decomposed infrastructure into 5 reusable Terraform modules (vpc, security_groups, alb, ec2, rds) to maximize maintainability across environments.

Kubernetes Observability Stack

Prometheus · Grafana · Loki · Alertmanager · Helm

github.com/irfanjat/k8s-observability

- Deployed full-cluster observability across 14 Prometheus scrape targets in under 35 minutes using kube-prometheus-stack and loki-stack Helm charts.
- Reduced mean time to detect (MTTD) incidents by defining 3 PrometheusRule CRDs — version-controlled in Git and auto-reloaded by the Prometheus Operator.
- Built a 6-panel Grafana dashboard consolidating live Loki log streams, CPU and memory metrics, and node-level data for unified cluster visibility.
